AWS-PARTNER

Cloud Native

Software Development

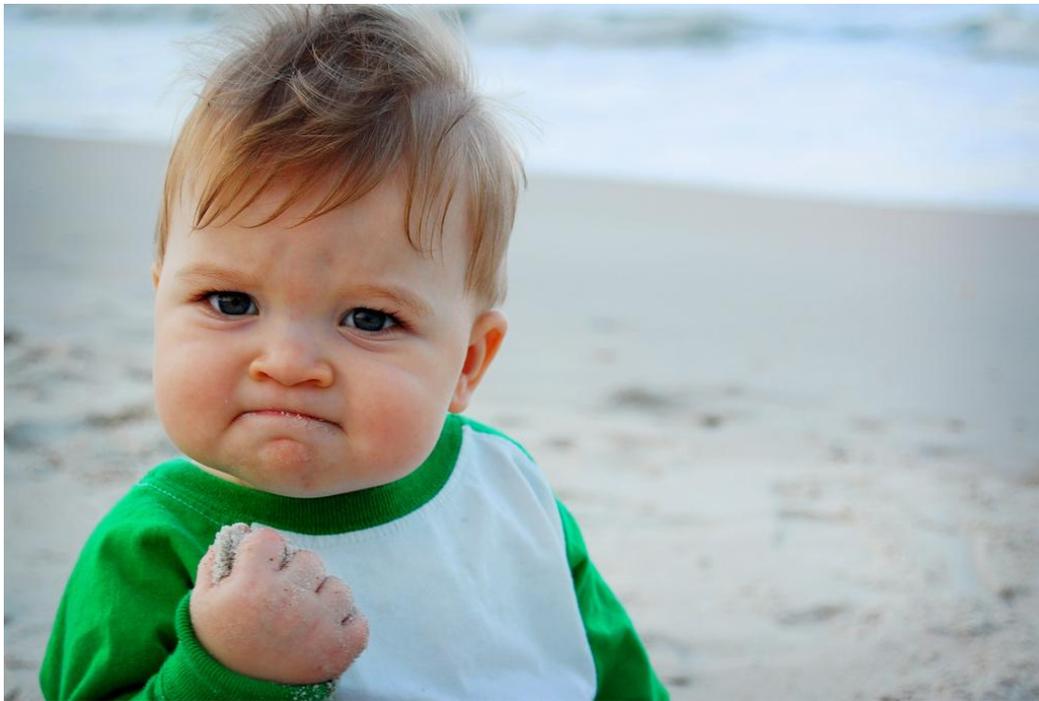

DARMSTADT
SINCE 2013

First Prototype – A monolith

Success!

After some months...

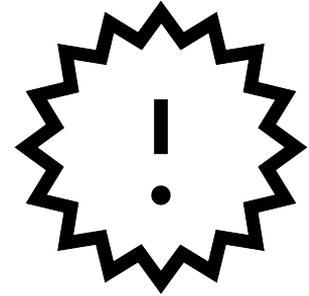

Problems with Monoliths

Adding new features will be difficult over time

Only vertical scalability

Need to deploy the full application on every small change

Time for Microservices

Easier to scale

Parallel development

Faster deployments

Independent technology stacks

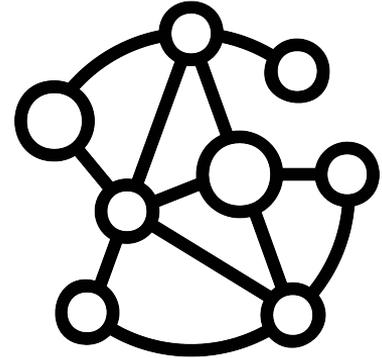

Did we solve all
the problems now?

New challenges

Communication between services

Debugging

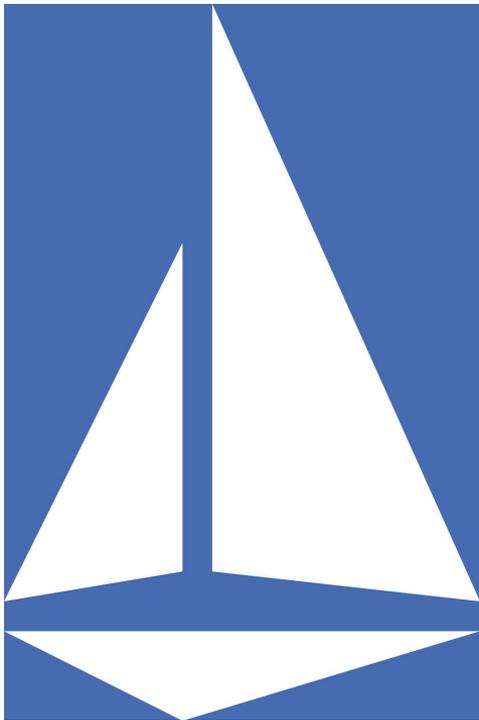

Deployment

How do I integrate this into each service?

Why not use a service mesh?

Benefits of Istio

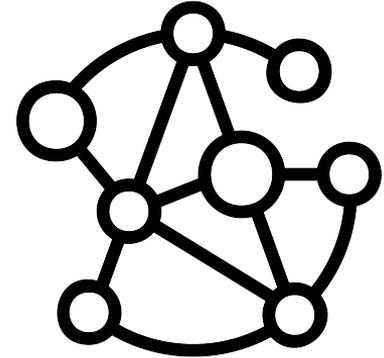

Communication between services

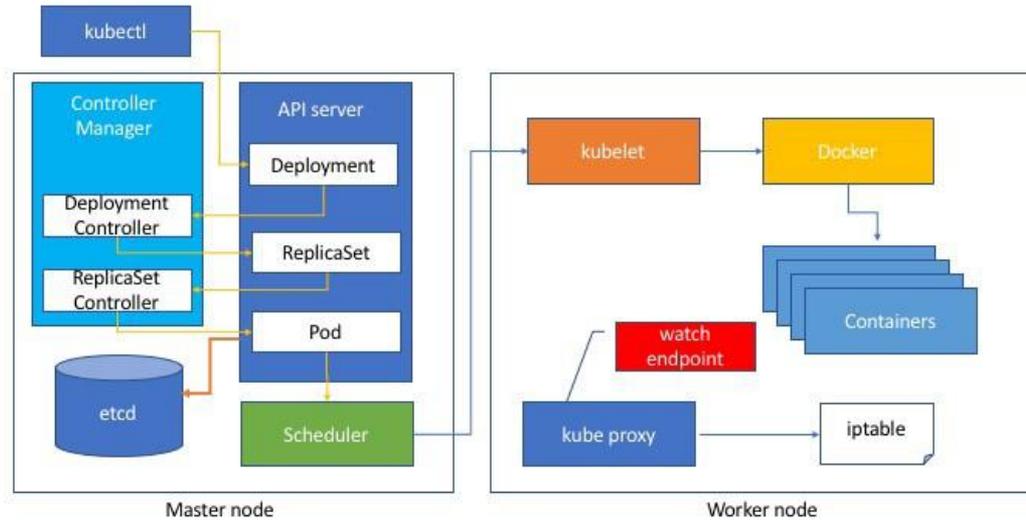

Debugging

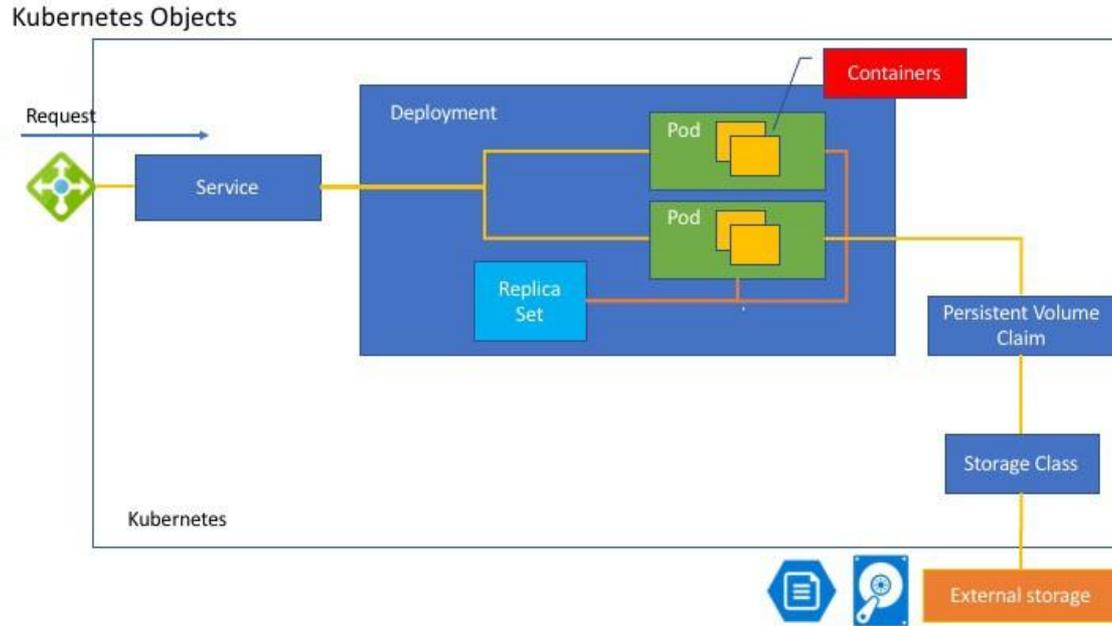

Deployment

CRDs

Traffic Management – Canary Releases

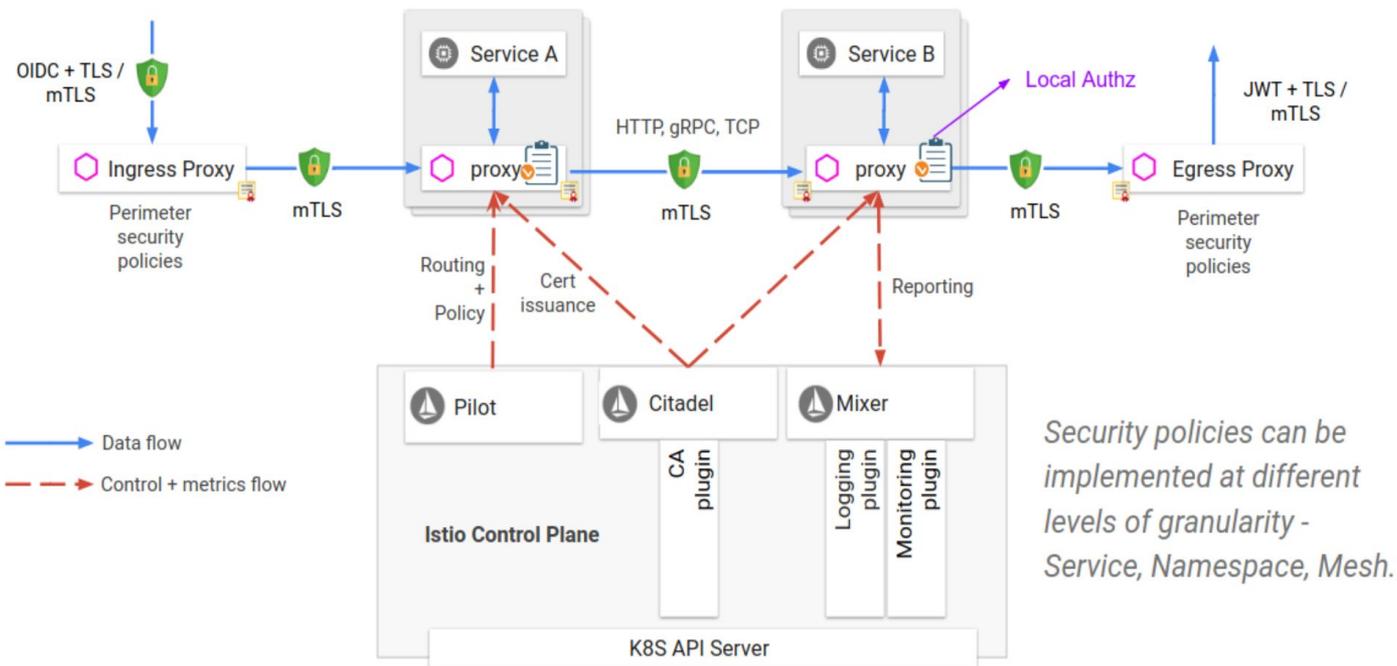

Traffic splitting decoupled from infrastructure scaling - proportion of traffic routed to a version is independent of number of instances supporting the version

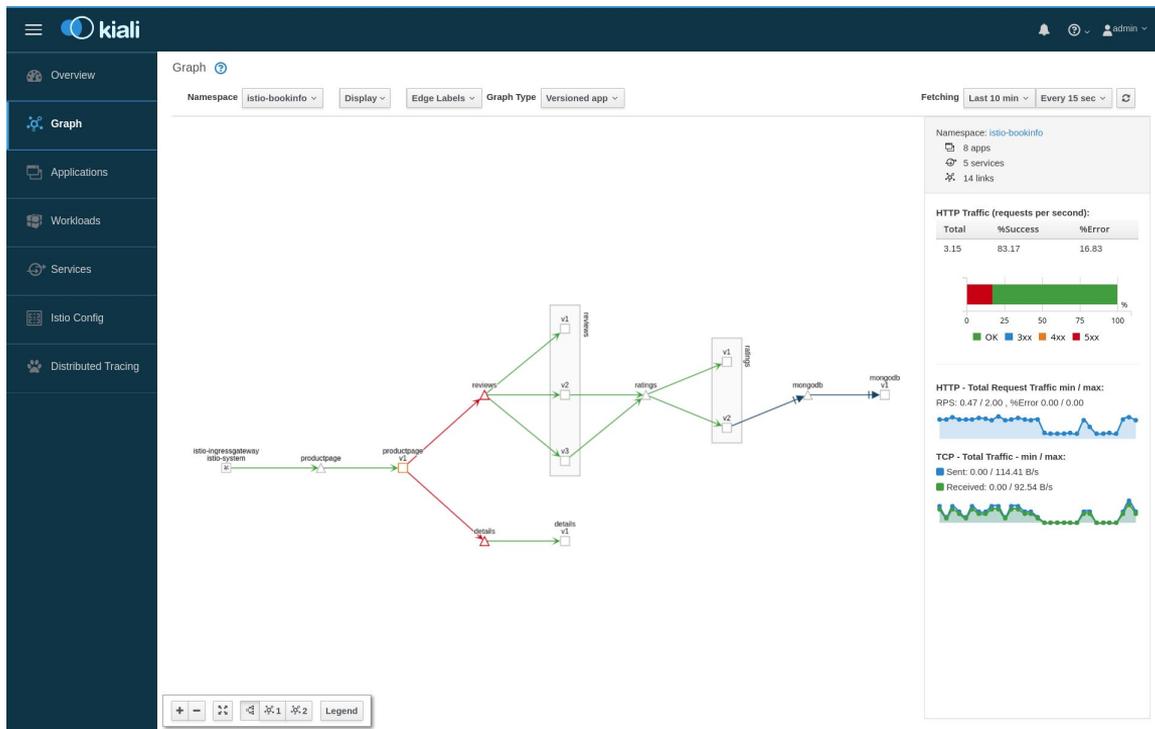

Content-based traffic steering - The content of a request can be used to determine the destination of a request

Mutual Authentication

Mesh Visualisation

Distributed Tracing

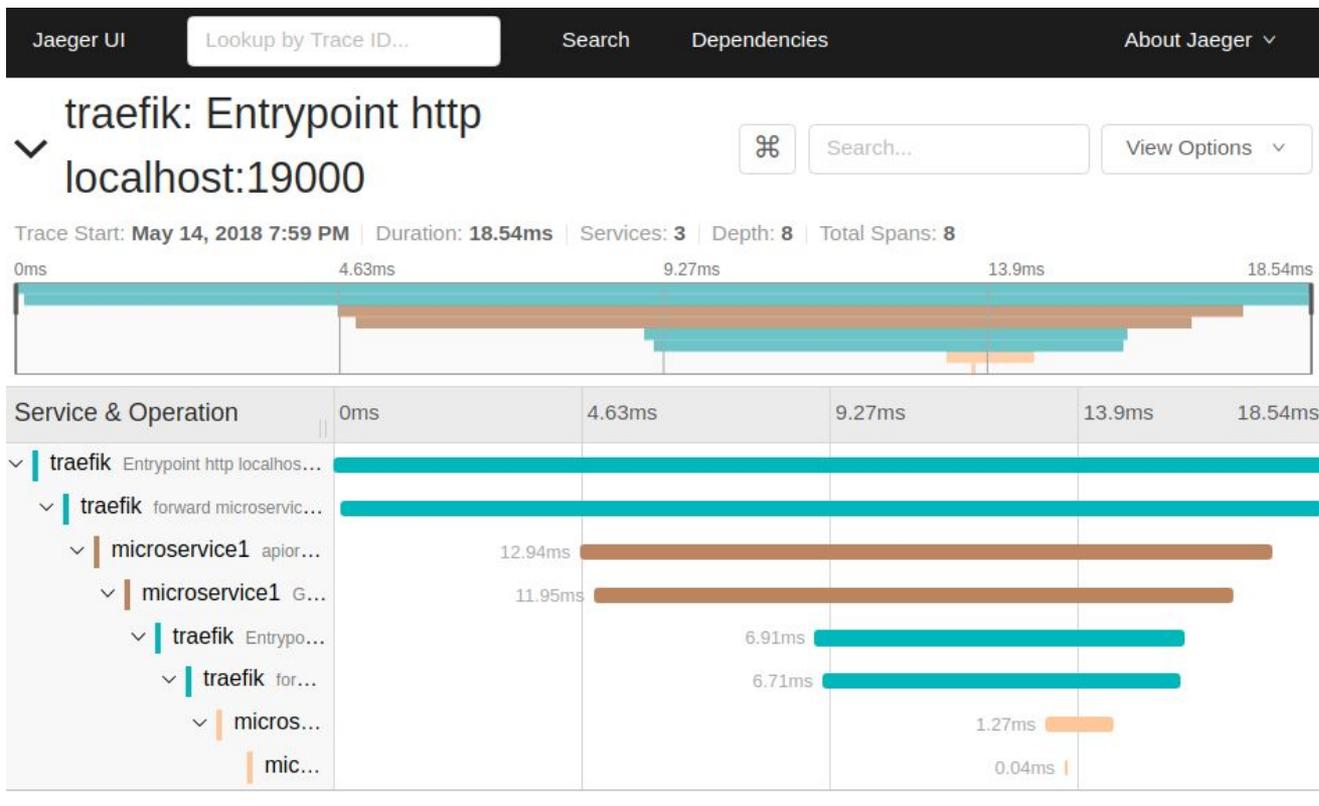

OpenTracing standard

Application must propagate HTTP Header e.g. x-request-id

Proxies build trace

Distributed Tracing

Are Service Meshes a must?

It depends...

Only really worth it with high number of microservices

If you need traffic management and monitoring features

Calculate high learning effort

Let's talk about...

Kubernetes
